

## New features in Symwriter version 1.1

### New installer and registration:

We have developed a new installer and registration system that are much easier to use with networks and multiple installations.

If you have already registered using the original system, you will be able to re-activate with your existing key. See 'Activating your SymWriter Licence' for more information.

### New features in the program:

- You can now copy highlighted symbol content to the clipboard to use in other programs.

Highlight the content you want to copy, then press CTRL+ALT+C or CTRL+SHIFT+C. You can then paste it as an image into other applications such as Powerpoint and MS Word.

NB: If you highlight over more than one line, all of those lines are copied. If you highlight *part* of one line, **the whole line is still copied**.

- Buttons to select all and select paragraph are now available for toolbars.

- Better spelling suggestions.
- You can now change the size of thumbnails in the graphic browser.

Select the 'Thumbnail size' from the 'View Menu', or set the default size in the improved 'Preferences Dialog'.

- Simplified preferences dialog for choosing your own settings for the program.
- Selected items in the symbol chooser are highlighted with a border, making it easier to see the detail of the image.
- You can now add personalised buttons to the launcher that allows you open an environment as well as your own toolbars.

### Revised PDF Manual on the CD:

We have revised the main program manual to make it more of a tutorial.

Section A is largely the same, but Section B now includes the 'Getting Started' guides to help make your own Environments.

The more in-depth matters are covered in a series of reference sheets, which can be found under the 'Help' menu. (PDF sheets R1- 6)

The most up-to-date manual is installed with the program as a PDF and is available from the 'Help' menu.
