Frogs

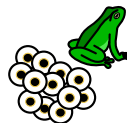

eggs

are

called

frog spawn.

In spring

frogs

lay spawn

in

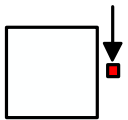

ponds

and

streams.

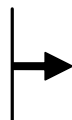

Tiny

tadpoles

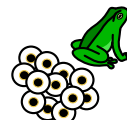

hatch

from

the

frog spawn.

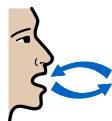

The tadpoles

live

and

breathe

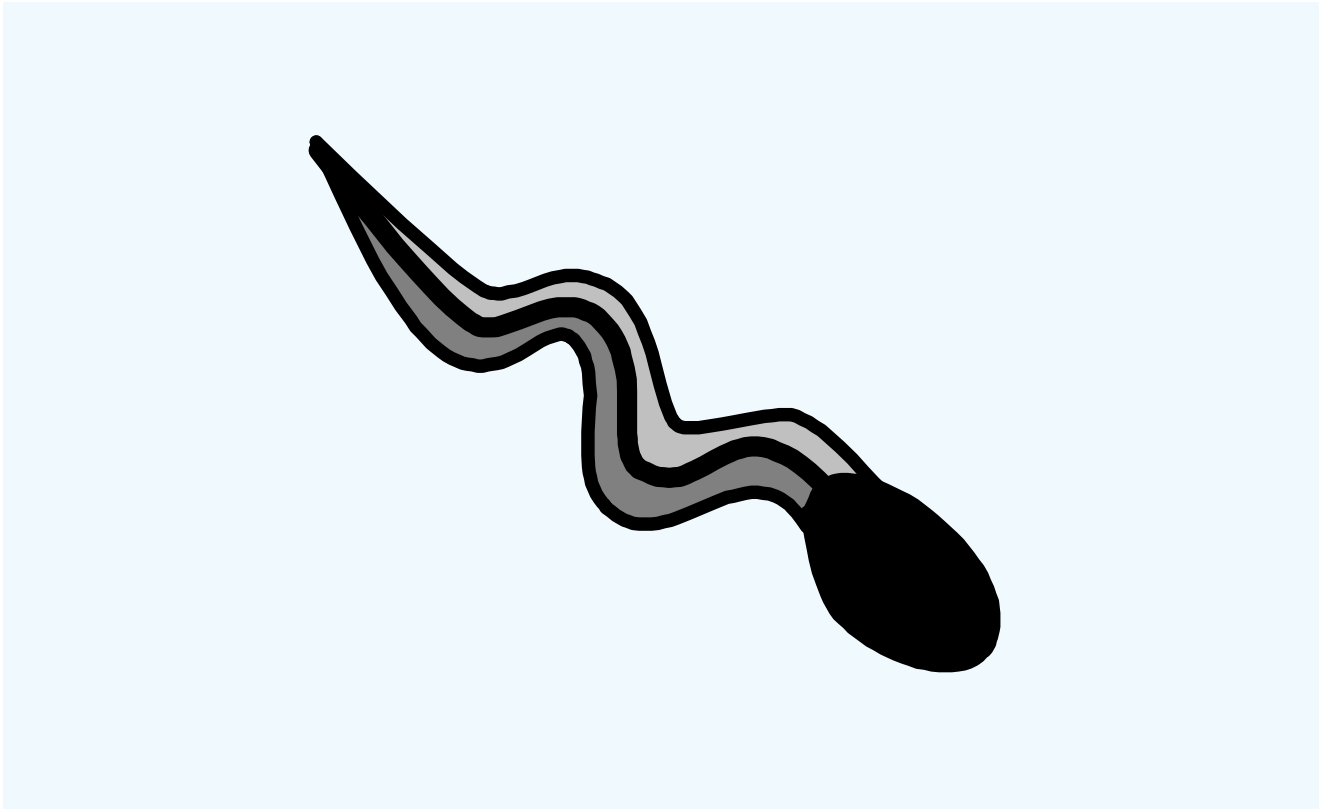

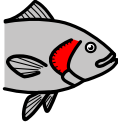

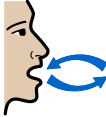

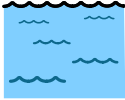

in

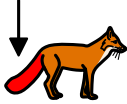

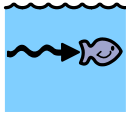

the

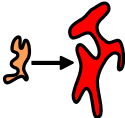

water.

 Tadpoles have 
 
 gills for 
 
 breathing in 
 
 water.

 Tadpoles have a 
 
 long 
 
 tail for 
 
 swimming.

 The tadpoles eat 
 
 plant life and 
 
 algae.

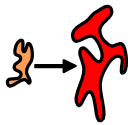

= 
 
 As the tadpoles 
 
 grow they 
 
 change.

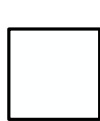

The tadpoles begin to grow lungs inside.

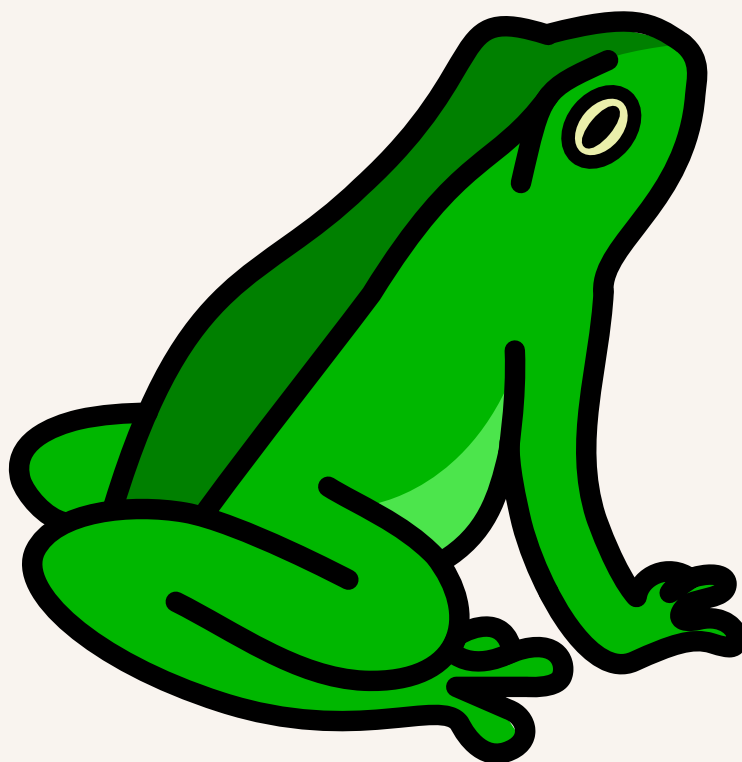

They grow back legs, then front legs.

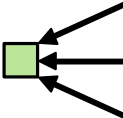

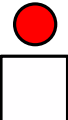

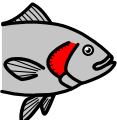

Their bodies change shape as they grow.

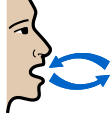

The tadpoles grow into tiny froglets.

 The froglets grow larger and absorb their tails.

 Skin grows over their gills.

 They use their lungs to breathe the air.

 The froglets become tiny frogs.

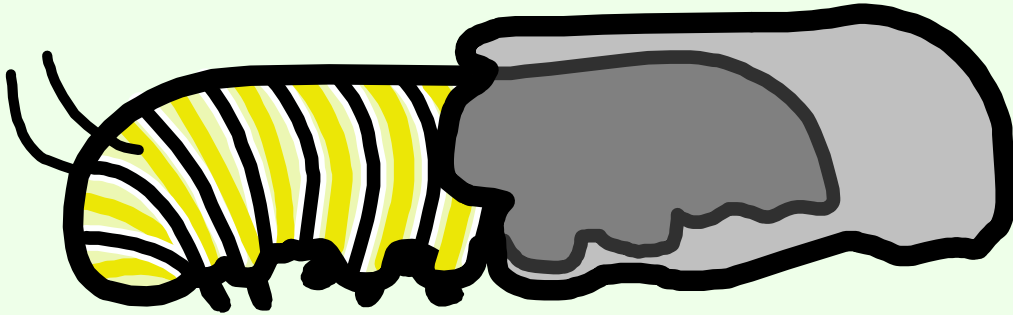

The  female  butterfly lays eggs  on  a  tree or  bush.

Inside  the  eggs  tiny  caterpillars  grow.

The  caterpillars  hatch  when they are  ready.

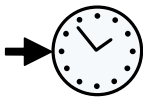

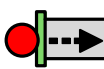

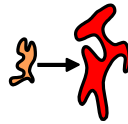

They  eat  their  shell and  start  eating  leaves.

 Caterpillars eat a lot and grow quickly.

 Caterpillars shed their skins several times as they grow.

 Caterpillars eat constantly.

 They eat and grow until ready to change.

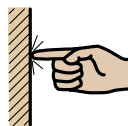

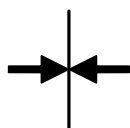

The caterpillar changes into a pupae.

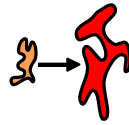

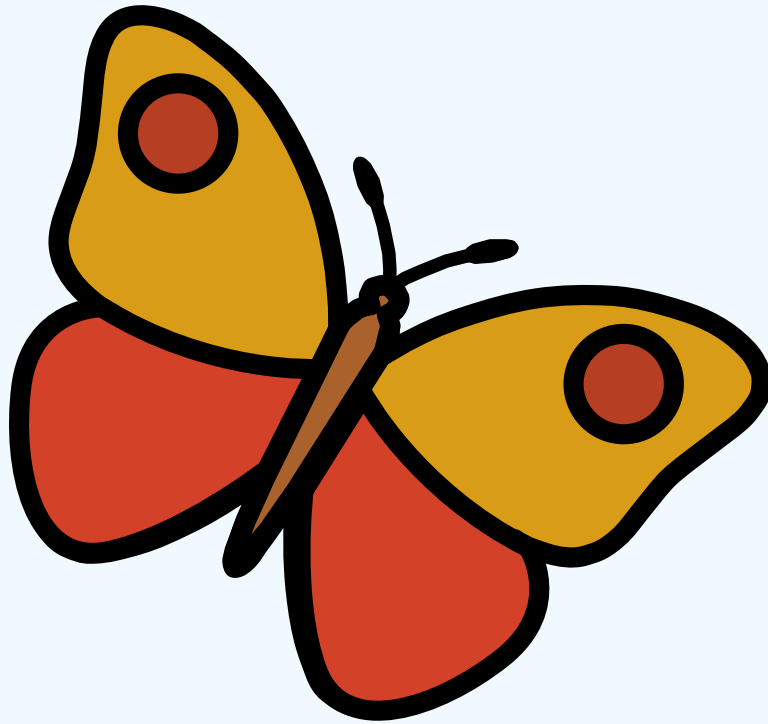

The pupae stage can last weeks or even months.

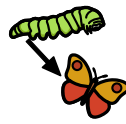

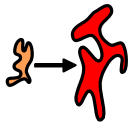

The pupae forms a hard outer covering.

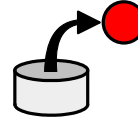

This protects against rain and predators.

Inside the pupae the caterpillar becomes a butterfly.

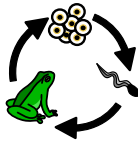

This change is called metamorphosis.

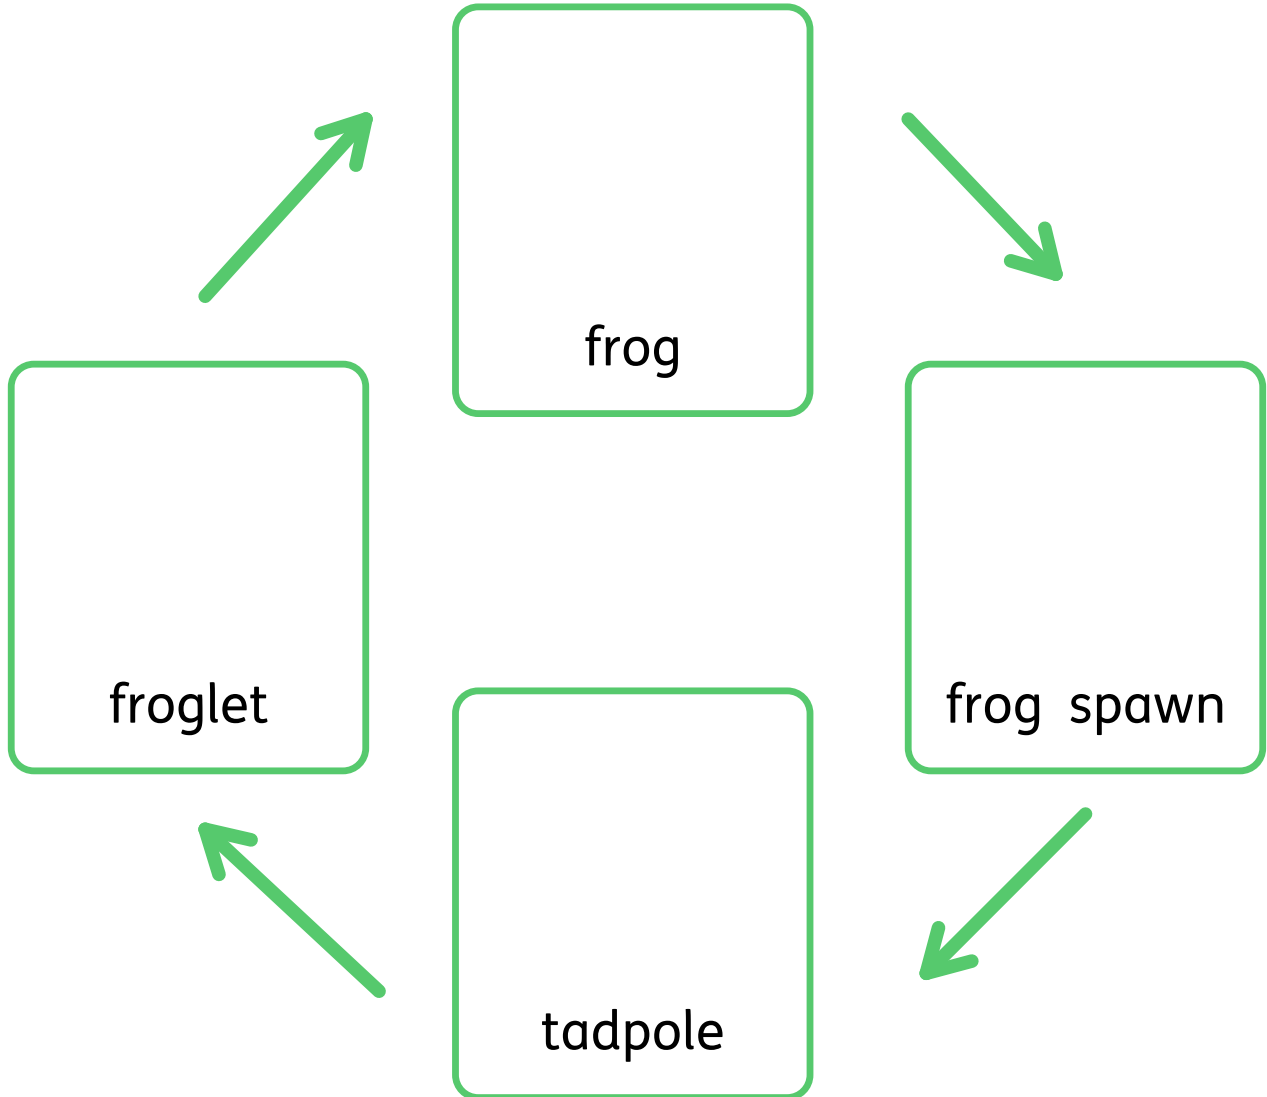

The pupae splits open and the butterfly emerges.

The butterfly will fly when its wings are dry.
