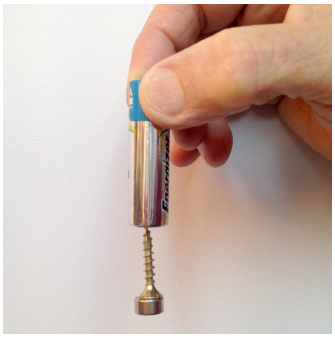
Spinning screws

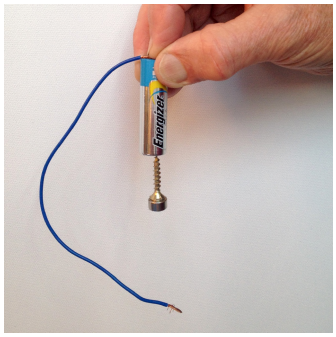
Equipment | magnet | screw | battery | wire

Put the magnet on top of the screw.

Put screw tip on the bottom of the battery.

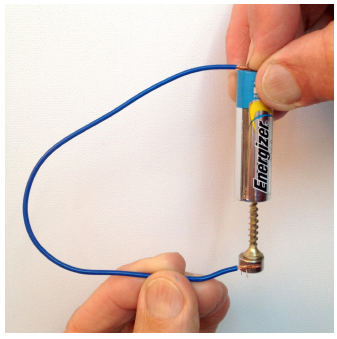


Put the wire on top of the battery.

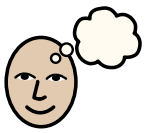


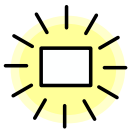
Find the other end of the wire.

Touch the wire on the edge of the magnet.

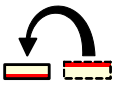


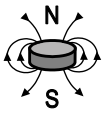
Watch the screw spin.

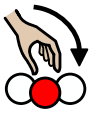




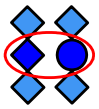
Think of new experiments



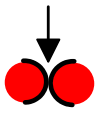


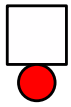


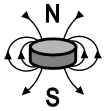
Turn over the magnet and try the experiment again



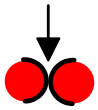
What is the difference?

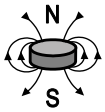




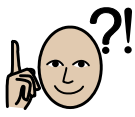


Touch the wire on the bottom of the magnet.

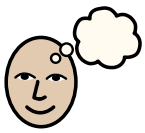


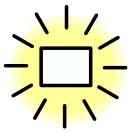


Touch the wire in the middle of the magnet.



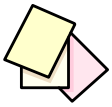
Does it work as easily?



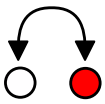


Think of new experiments

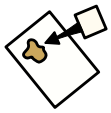
Decorate the screw.

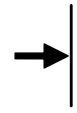


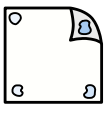
Get some small bits of paper.



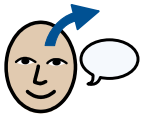
Make some wings or a body.



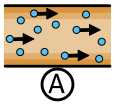




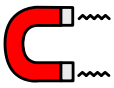
Stick it to the screw with blu-tac.

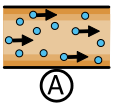


Explanation



The battery makes a current.



+


=

Magnetism and a current creates movement.

medium string			
heavy string			

skiffle bass

Equipment

a cardboard or wooden box without a lid

a washer or bead

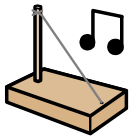
different threads: twine, light string, heavy string

60cm strip of wood with a hole at the end

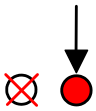
Tie the washer or bead to the end of the string.

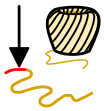
Put the other end of the string through the hole in the box.

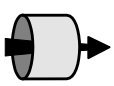
The washer or bead must be inside the box.

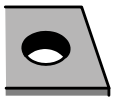


skiffle bass





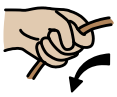
Thread the other end of the string


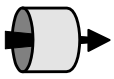
through


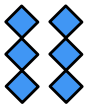
the hole

in

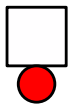
the stick.



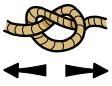


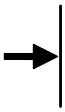
=


Pull the string through so it is the same as the

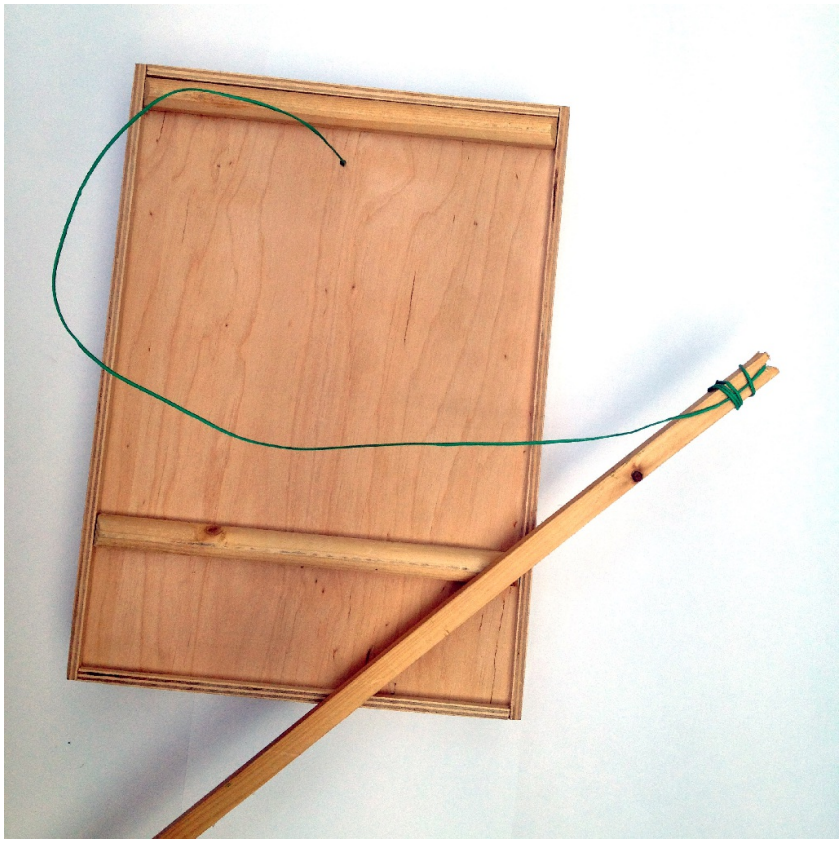
picture


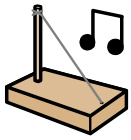
below.



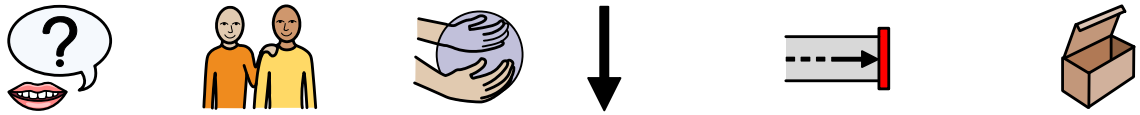


Tightly tie the string to the stick.

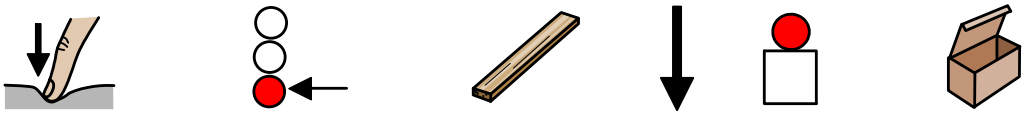




skiffle bass

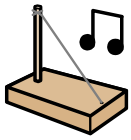


Ask a friend to hold down the end of the box.



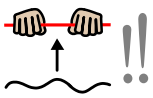
Press the bottom of the stick down on the box

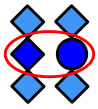
Pull the top of the stick so the string tight.



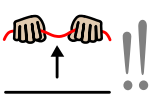
skiffle bass

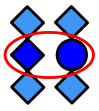
Pluck the string and listen to the note.



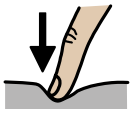


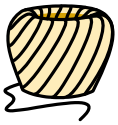
Tighten the string, What is the difference?

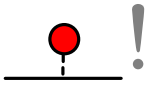


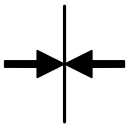


loosen the string, What is the difference?

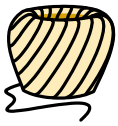


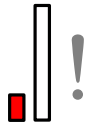






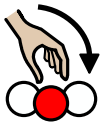
Press the string lower against the stick.

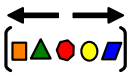




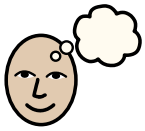
The string is shorter.

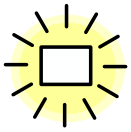
Is the note different?





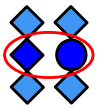
Try a range of notes.





Think of new experiments

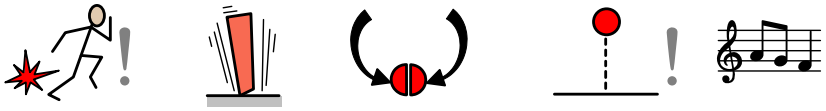
Change the thickness of the string.



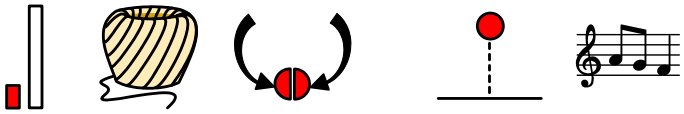
What is the difference?

Explanation

A tight string vibrates faster.



A faster vibration makes a higher note.



A short string makes a high note.

A thick string makes a low note.

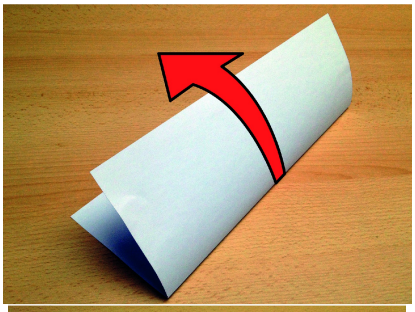
Aeroplane engineers

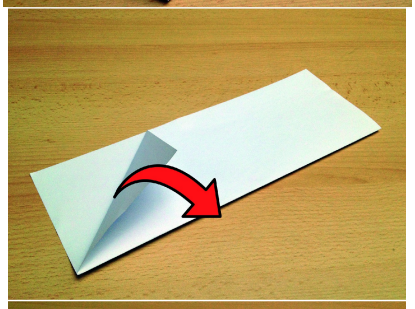
Equipment

sheets of paper

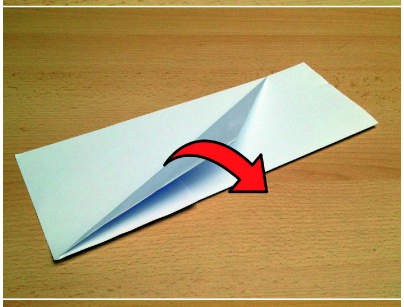
Fold the paper in half.



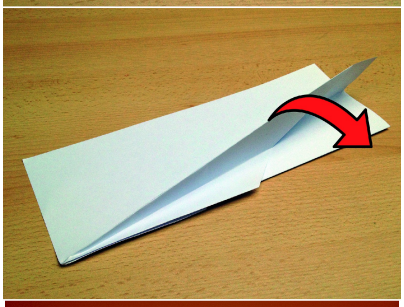
Fold the corner back.



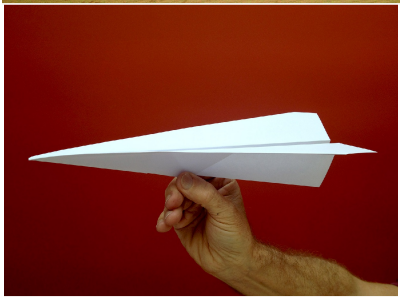
Fold the edge back.



Fold the edge back again.



Turn over and fold the same.

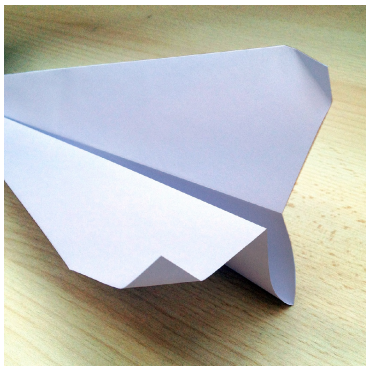


Unfold the plane.

Aeroplane engineers

Fold up the end of the wings a little.

What difference does the fold make?

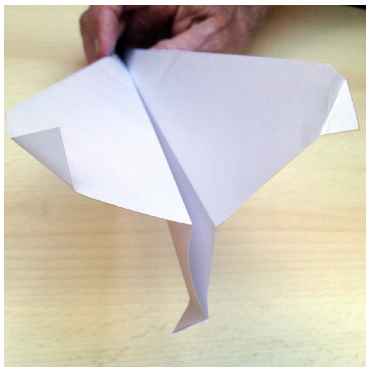


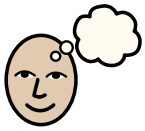
Try folding the wings up more!

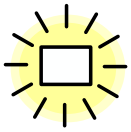
What is the difference?

Fold the ends of the wings + the body clockwise.

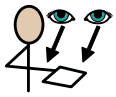
What is the difference?

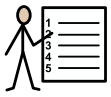






Think of new experiments

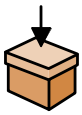




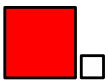
Find a book that shows you how to make paper planes.

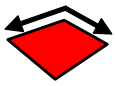
How much better are these?

Explanation

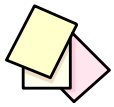


Air resistance slow objects when they fall.

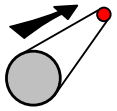




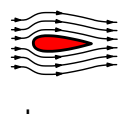
Paper is light and has a large area.

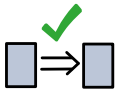


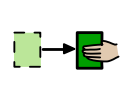
Air resistance means paper takes time to fall.



A good paper plane can fly a long way while it is falling.







Wing shape causes the air to move the plane in different directions.

Invisible treacle data sheet

Which is the slowest?	fastest	medium	slowest
1 One magnet			
2 Two magnets			
3 Three magnets			

Invisible treacle

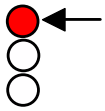
Equipment | copper tube | 4 magnets | small object

Touch the magnet onto the copper tube.

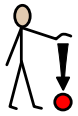
Is copper magnetic?

yes | no

Invisible **treacle**



Hold the tube at the top so it is vertical.

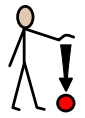


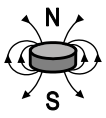
Drop the small object down the tube.

Does it fall quickly?

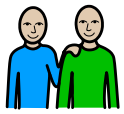
yes

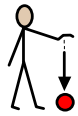
no

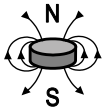


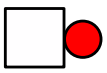


Drop 2 magnets down the tube.

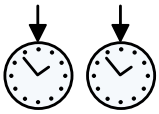




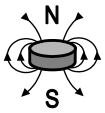




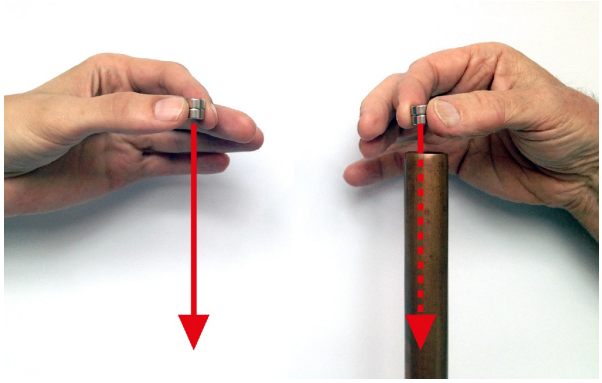
Ask a friend to drop 2 magnets next to the tube



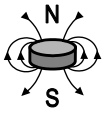
at the same time.



Which magnets fall quickest?

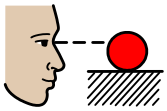


Invisible **treacle**



Look down the tube while the magnets are falling.

Make sure the tube is vertical.



What do you see?

Think of new experiments

Try 4 magnets instead of 2 magnets.

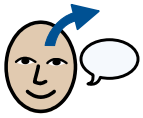
What is the difference?

Try 3 magnets.

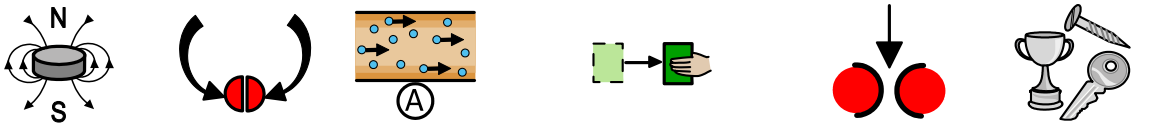
What is the difference?

Try 1 magnet.

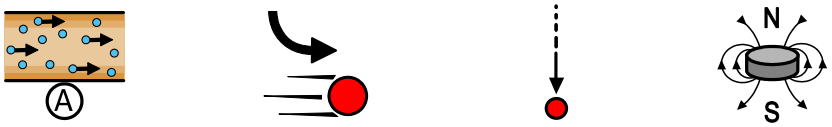
What is the difference?



Explanation



Magnets create current when moving near to a metal.



The current slows down the falling magnet.

Kelly wobbles

Equipment

half a table tennis ball

plasticine

cocktail sticks

3 balls of plasticine

Fill the half a table tennis ball with plasticine.

smooth over the top.

Poke a cocktail stick in the centre down to the bottom.

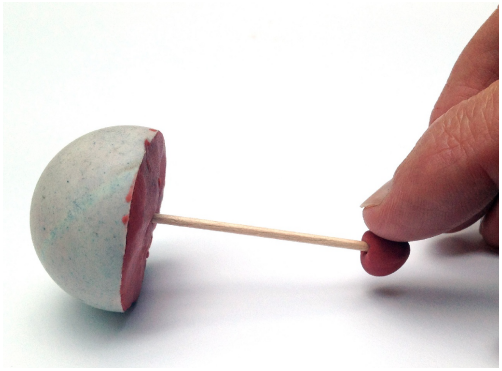
Kelly wobbles

Put 1 small piece of plasticine on the top of the cocktail stick.

Push the top, does it bounce back?

yes

no



Put 2 small pieces of plasticine to the top of the cocktail stick.

Push the top, does it bounce back?

yes

no

Kelly wobbles

Does it wobble differently?

yes

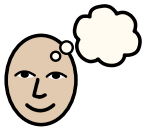
no

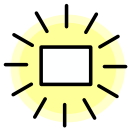
Put 3 small pieces of plasticine to the top of the cocktail stick.

Push the top, does it bounce back?

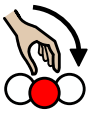
yes

no



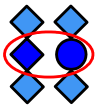


Think of new experiments

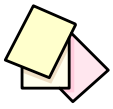


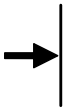
Try the experiment again.

Use a shorter cocktail stick.

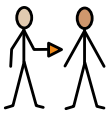


What is the difference?



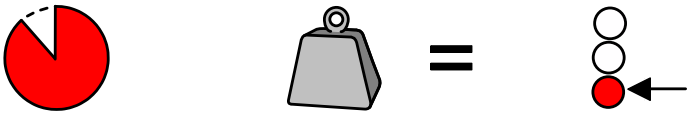


Use paper to decorate your Kelly.

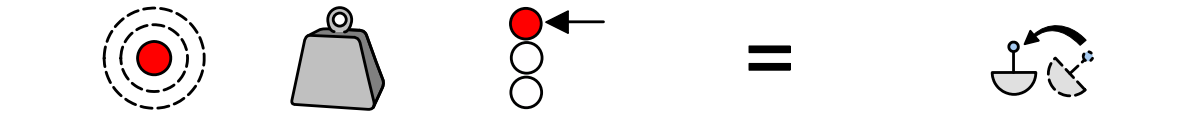


You could decorate your Kelly = like a clown.

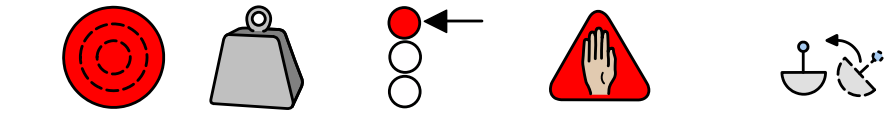
Explanation



Most of the weight is at the bottom.

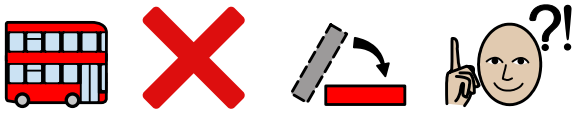


A small weight at the top means it bounces back.



A big weight at the top stops it bouncing back.

Double decker buses have a lot of weight low down.



Buses don't fall over easily!

Objects

All objects must fit in the beaker.

some heavy

some light

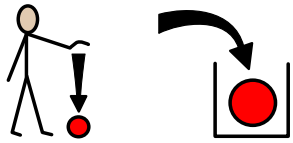
some rough

some smooth

Put the card on top of the beaker.

Put an object on top of the card.

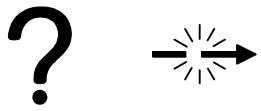
Slowly Pull out the card and see what happens.



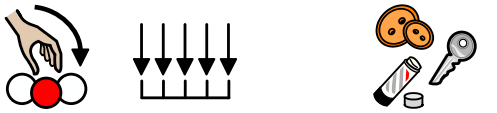
Drop it in

Try the experiment again.

Pull out the card quickly.

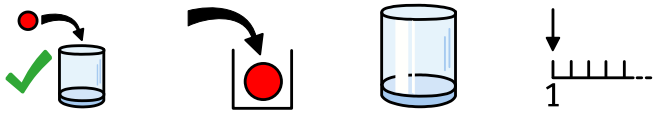


What happens?

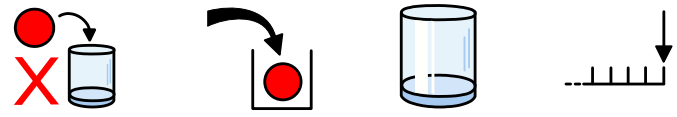


Try all the objects.

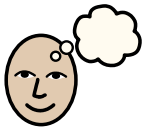
Put the objects in order:

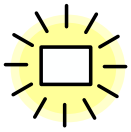


Easiest to fit in the beaker first.

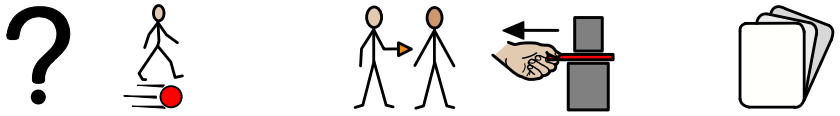


Hardest to fit in the beaker last.

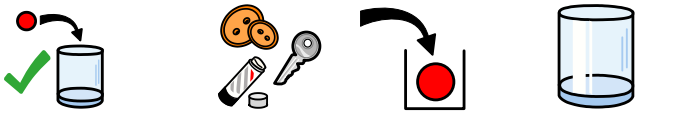




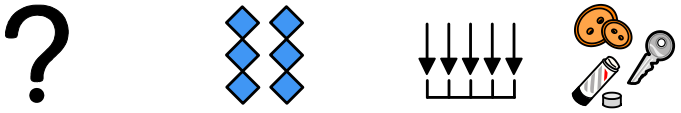
Think of new experiments



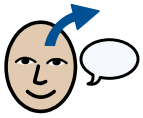
How slowly can you pull out the card?



to get an object in the beaker.

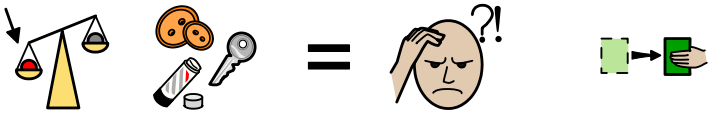


Is it the same for all objects.

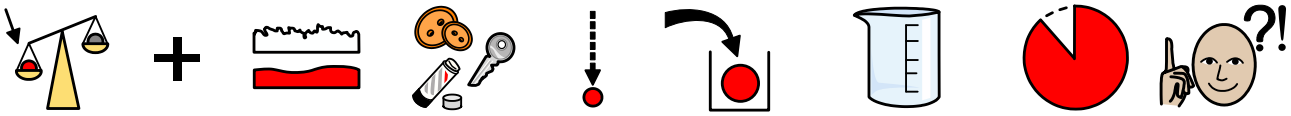


Explanation

Smooth objects create less friction.



Heavy objects are harder to move.



Heavy and smooth objects fall into the beaker most easily.

Rainmaker

Equipment

soil

cling film

sticky tape

large clear container

small clear container

Put the soil in the large container.

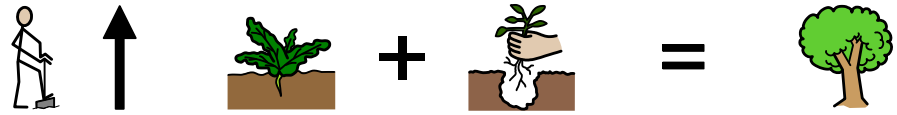
Make a hole in the soil.

Put the small container in the hole.

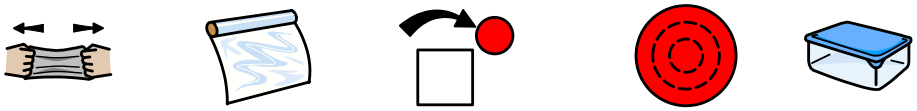
Make some mountains in the soil.

Rainmaker

Fill the small container with water.



Dig up a weed and plant it like a tree.



Stretch the cling film over the large container.

Put tape round the cling film and container.

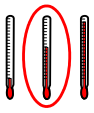
Make sure there are no holes.

Rainmaker

Put

the container

in



a warm

place.

On a sunny day

put

the

container

in

the

sunlight.

Wait for

a

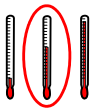
few hours.

Wait

a few days

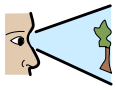
if it

is not

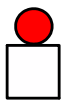


warm.

What do



you see



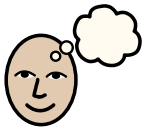
on

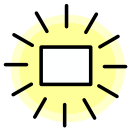
the cling film?

Where

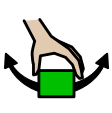
has it

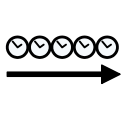
come from?





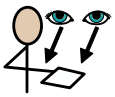
Think of new experiments

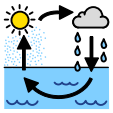




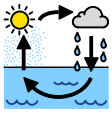
Use dry soil and wait for a very long time.

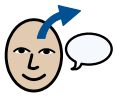
The drops from the cling film moisten the soil.





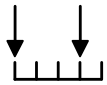
This experiment shows the water cycle.

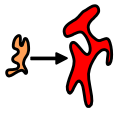


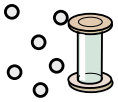


The water cycle explains where rain comes from.

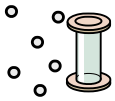
Explanation

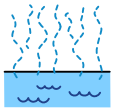




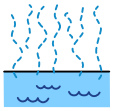


The warmth makes some of the water turn into a gas

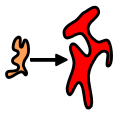


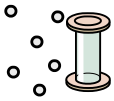


The gas is water vapour.

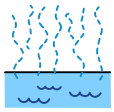


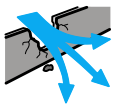
Water vapour is invisible.

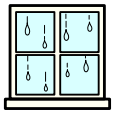


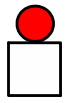


Water becoming gas is called evaporation.









The water vapour cannot escape and condenses on the cling film.

The water falls to the soil.

Wizzy Washing up liquid

Equipment | card | sink | scissors | pencil

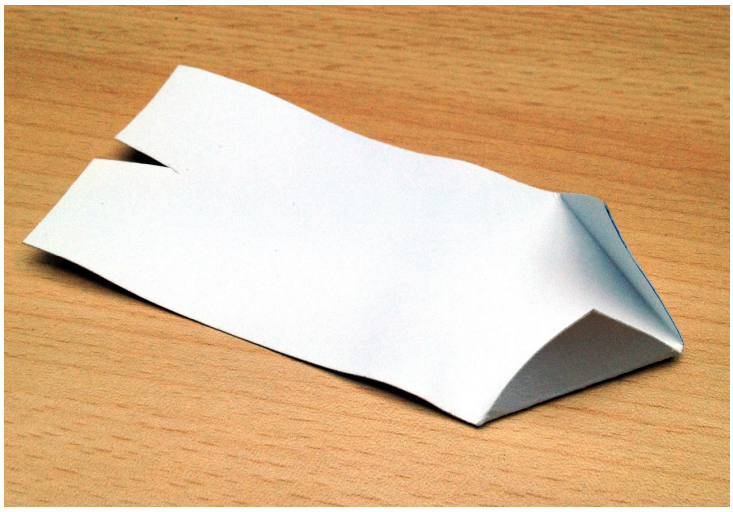
washing up liquid | in a | small | pot

Fold | the front | corners | of | the card.

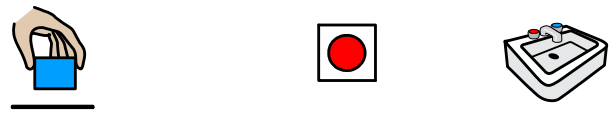
Cut | a triangular | piece | at the other | end.

Make | it | like | the | picture.

You | have | a | paper | boat.

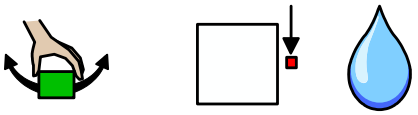


Wizzy Washing up liquid



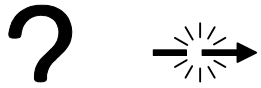
Place the boat in the sink.

Dip the point of a pencil in the washing up liquid.

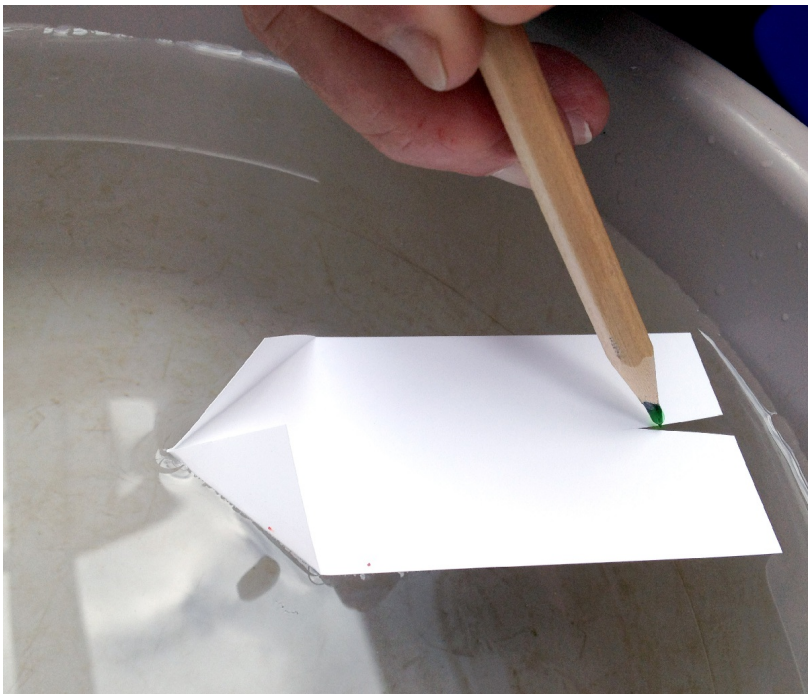


Use a tiny drop.

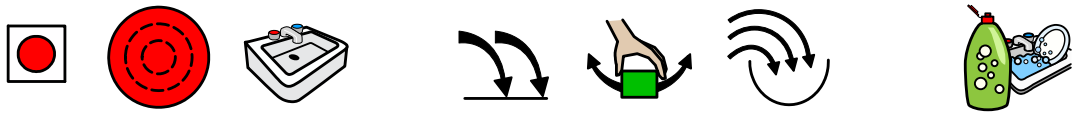
Touch the pencil to the v at the back of the boat.



What happens?

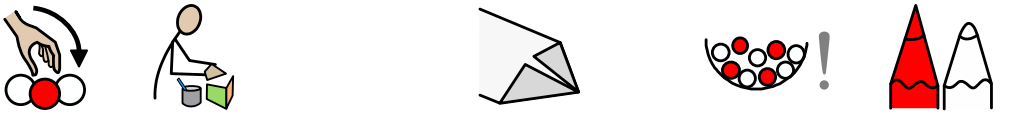


Think of new experiments

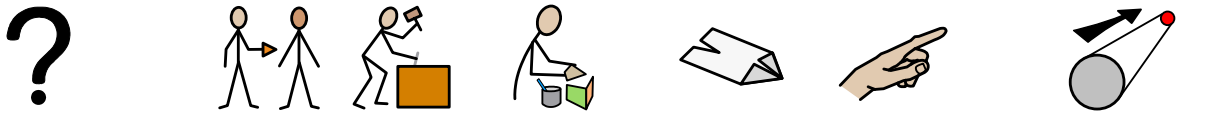


In a large sink try again using more washing up liquid.

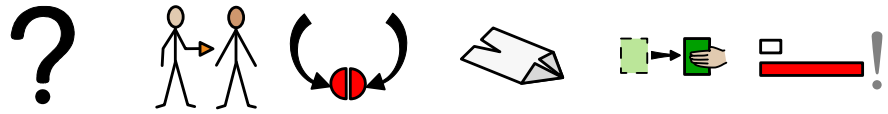
Use a new piece of card for each experiment.



Try making the front of the boat more pointed.

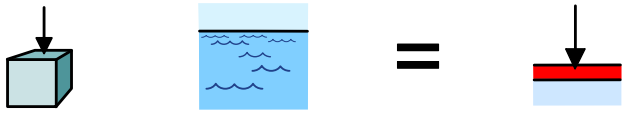


What can you do to make the boat go a long way?

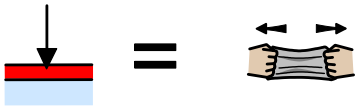


How can you make the boat move further?

Explanation

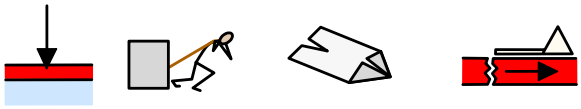


The surface of water is like a skin.



The skin is stretched.

Washing up liquid tears the skin at the back of the boat.



The skin pulls the boat forward.

Light entertainment

Equipment

white paper

blu-tac

sticky tape

red filter

green filter

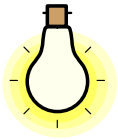
2 2 torches, = equally bright.

Carefully fasten the red filter to 1 one torch with sticky tape.

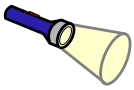
Carefully fasten the green filter to the other torch.

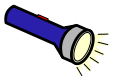
Find a wall in a dark place.

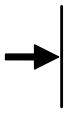
Fasten the white paper to the wall.



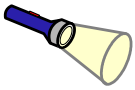
Light entertainment

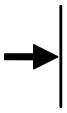




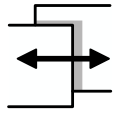


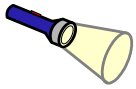
Shine the red torch on the paper.



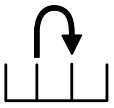


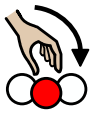
Shine the green torch on paper .

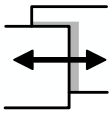


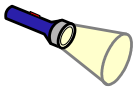


Do not overlap the green and red beams.

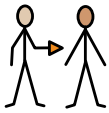


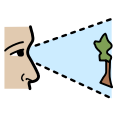






Next, try overlapping the green and red beams,





What do you see?

Think of new experiments

Look through the red filter.

Look through the green filter.

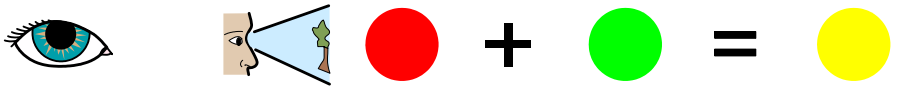
Now put one filter in front of the other filter.

Look through both filters.

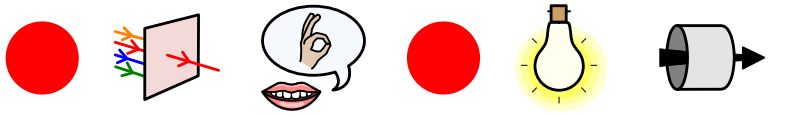
What do you see?

Explanation

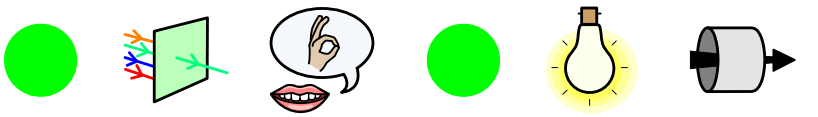
Shining both torches you can see both colours.



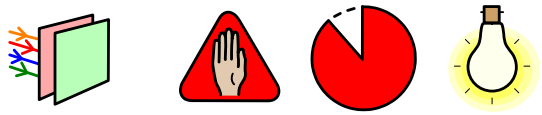
The human eye sees red and green as yellow.



A red filter allows red light through.



A green filter allows green light through.



Both filters stops most light.

Investigation 1: Teabag trouble

Equipment

loose tea

3 glasses

3 clippits

3 pegs

teaspoon

kitchen roll

j-cloth

newspaper

material

Imagine you have no tea bags.

Mum's friend is coming at tea time.

You have loose tea.

You do not have a tea strainer.

Can you make tea bags?

Which material is best to make tea bags?

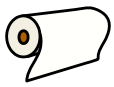
Making teabags

Put

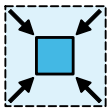
a teaspoon of

loose tea

in the middle of

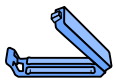
a piece of


kitchen roll.

Fold up


the edges around
the

loose tea.

Use
a


clippit
and

fasten
the

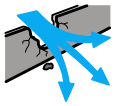
loose tea

inside
the

kitchen roll.

It is important
the

loose tea

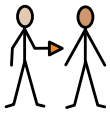
cannot


escape.

Repeat
using
the

j-cloth
and
the

newspaper.

Now


You

have
3
3

teabags.

Carefully

fill
3
3

glasses
with

hot water.

The experiment

Clip a peg to the top of each teabag.

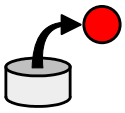
Ask 2 two friends to help.

Give each friend a teabag + and glass.

Dip the teabags in the hot water.

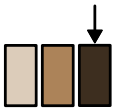
Dip the teabags for about a 1 minute.

The experiment



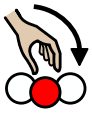
Remove the tea bags.

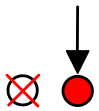
Do not drink the tea!



Which teabag is the darkest colour?

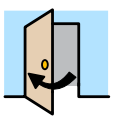
Did any tea bags leak?



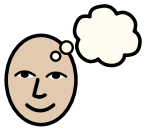


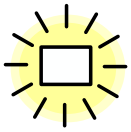
Try other materials.

What material makes the best teabag?



The shop opens and mum dashes to buy proper tea bags.





Think of new experiments

?     

Why are some materials are better for making tea bags?

?  

Can you explain?

?     

Can you think of better materials to use?

Design a poster showing your experiment.

2 Investigation 2: Super spinners

Equipment

template to make tray

template to make spinner

paperclips

scissors

sticky tape

Many things fly through the air.

Aeroplanes, helicopters and gliders can fly.

Animals like birds and insects can fly.

Air is important for flight.

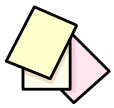
No air means no flight.

You will learn about things moving in the air.

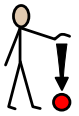
1

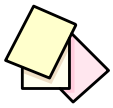
Experiment 1

1

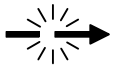


Hold 1 piece of paper flat.

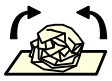


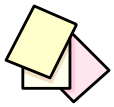


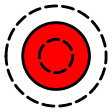
Drop the paper.



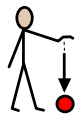
What happens?

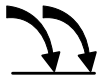




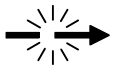


+

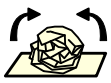




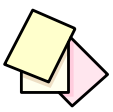
Scrunch up the paper a bit and drop it again.

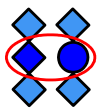


What happens?



Scrunch the paper tightly.

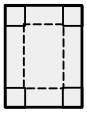




Does the paper fall differently?

1

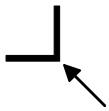
Experiment 1



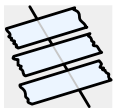
Look at the tray template.

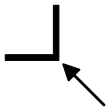
Carefully cut along the dotted lines.

Fold along the straight lines.

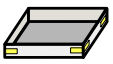


Fold the corners.

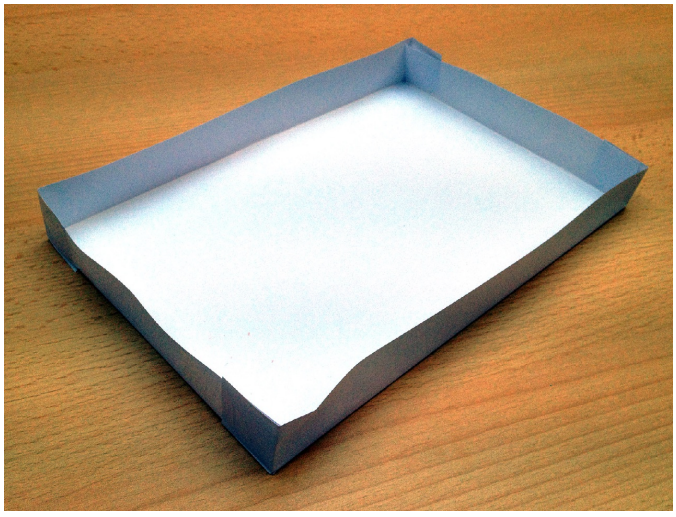




Put sticky tape to fasten the corners.



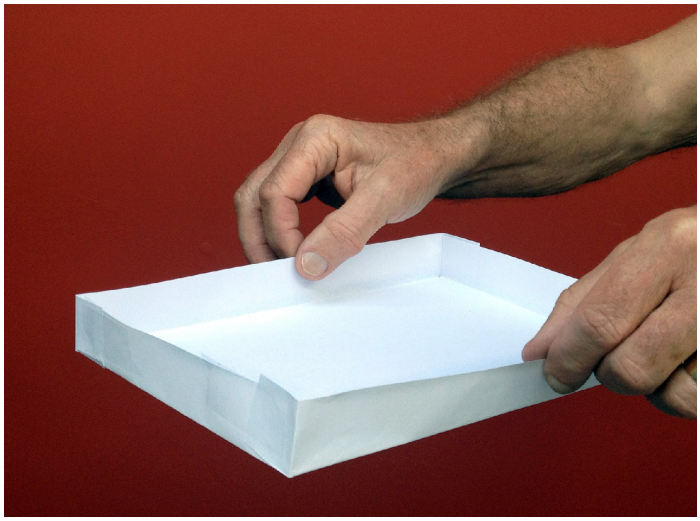
Make your tray like the picture.



1

Experiment 1

Hold the tray the right way up like the picture.

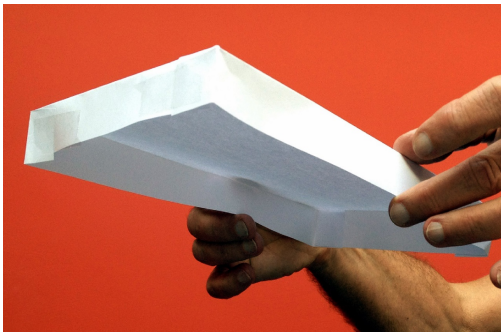


Drop the tray.

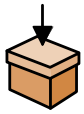
Does the tray fall differently to the piece of paper?

Try dropping the tray upside down.

What is the difference?

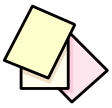


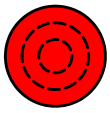
Explanation

Air resistance affects falling objects.

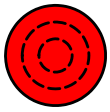
   





Paper has a large area.

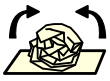


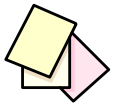
The air resistance is large and the paper is light.

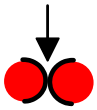
  

The piece of paper falls slowly.





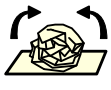


Scrunched up paper has a smaller area touching the air.

The air resistance is smaller.



The scrunched up paper falls faster.

Explanation

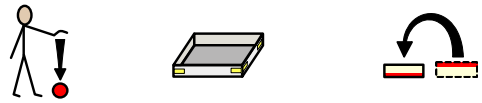
Dropping the tray the right way up.

The air can flow smoothly past the edges.

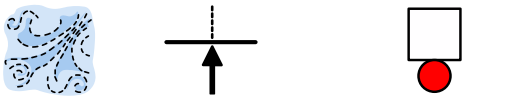
The tray is streamlined.

The tray falls smoothly.

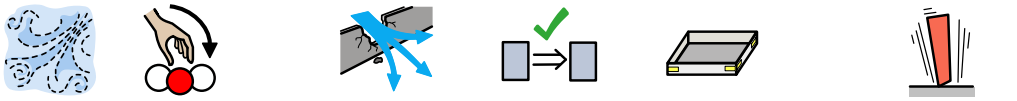
The tray does not wobble.



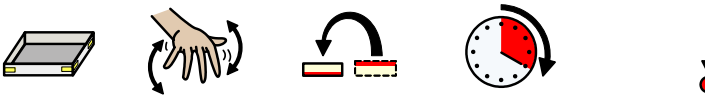
Dropping the tray upside down.



Air is trapped underneath.



The air tries to escape causing the tray to wobble.

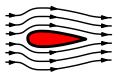


The tray might turn over during the fall.

Ideas to talk about

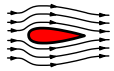
air resistance

area



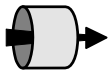
streamlined

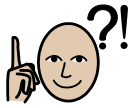
+

=


Cars, planes and bikes are streamlined.

+



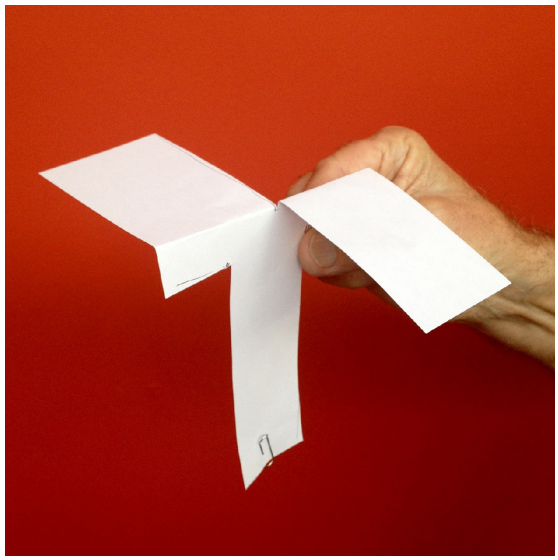


Cars, planes and bikes can move fast through air easily.

Think about cyclist's clothing.

2

Experiment 2



Cut out the medium spinner.

Fold it like the picture.

Put a paper clip at the bottom.

Drop it from a height.

you must ask before climbing on furniture.

Watch the spinner during the fall.

Try it several times.

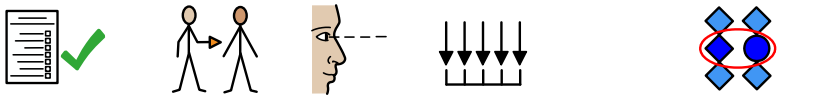
Does it spin?

Does it start spinning straight away?

2

Experiment 2

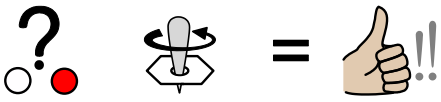
Repeat the using the large spinner.



Make sure you look for all the differences.

Write down all the differences you can.

Try again using the small spinner.



Which spinner is best?

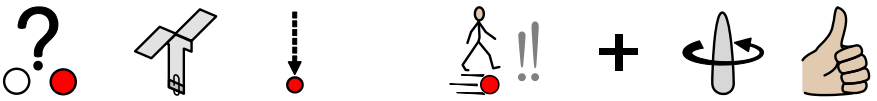
Can you improve the spinners?

Think of new experiments

Add more paper clips to the bottom.

Try cutting the wings smaller.

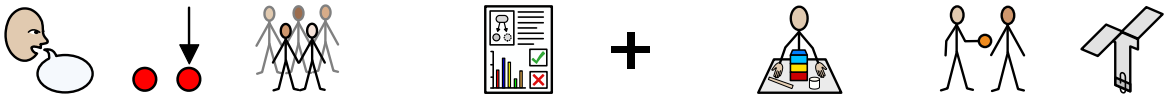
Try more experiments.



Which spinner falls the slowest and spins well?

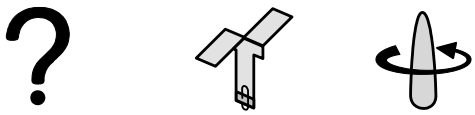
Write down the results.

OR

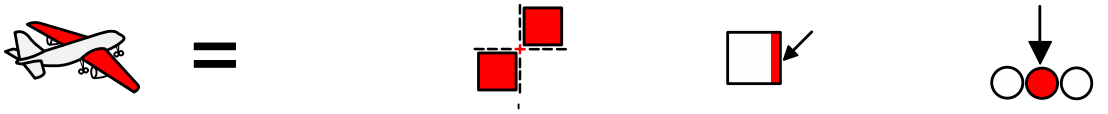


Tell other people the results and demonstrate your spinners.

Explanation



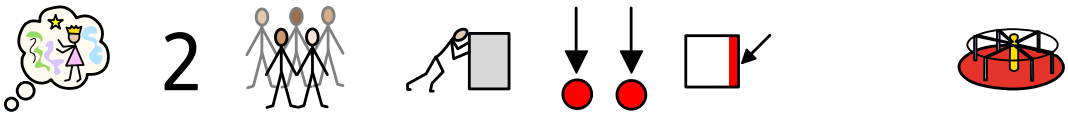
Why does the spinner spin?



The wings are on diagonally opposite sides of the middle.

The air resistance pushes the wings in opposite directions,

causing the spinner to spin around the centre.



Imagine 2 people pushing either side of a roundabout.

1

Group work 1: Slippery slopes

Equipment

card

ruler

compass

parcel tape

scouring sponge

paperback book

plastic cup

2 two pieces of wood measuring: 30 x 12 x 1 cm

2 two pieces of wood measuring: 30 x 12 x 1 cm

1 1 pieces of wood measuring: 3 x **4.5** x 8 cm

1 1 pieces of wood measuring: 3 x 4.5 x 8 cm

At what angle do objects slide down a slope?

During this experiment you will find out.

Make the slope

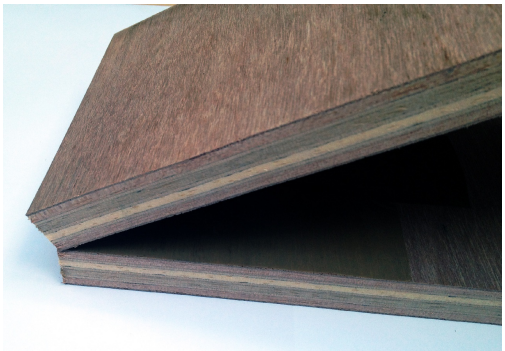
Put the ends of the 2 pieces of wood together.

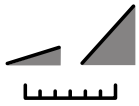
Use strips of parcel tape to join the wood together.

Make sure the tape = pressed down + sticks well.

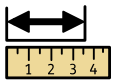
The parcel tape makes a hinge.

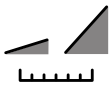
Fold 1 piece of wood back.

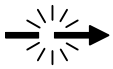




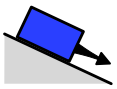
Steepness scale

This experiment


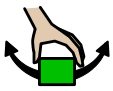
measures


steepness of a slope


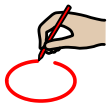
when

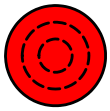
an object


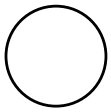
slides.



Use
a

compass


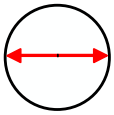
to draw


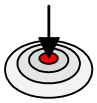
a big


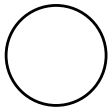
circle
on

the card.

Draw
a

line


across


the centre of


the circle.

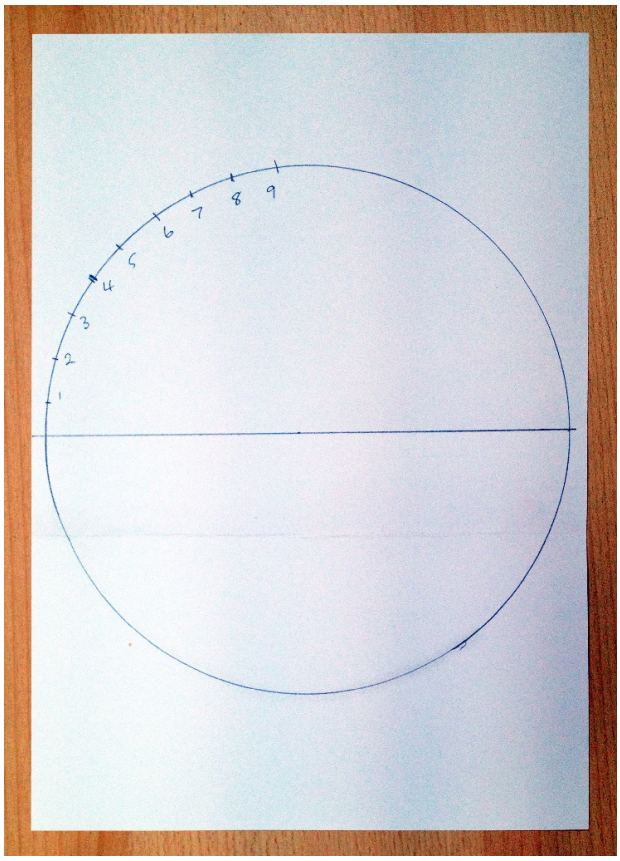
Steepness scale

Make marks along the edge of the circle every 2 cm.

Mark a quarter of the circle.

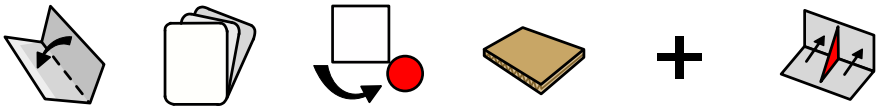
This is a steepness scale.

Use the ruler to mark accurately like the picture.

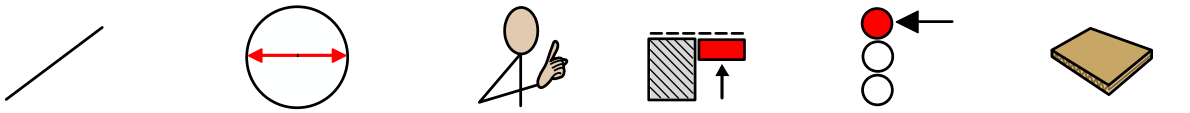


Putting together the apparatus

Putting together the apparatus is tricky.

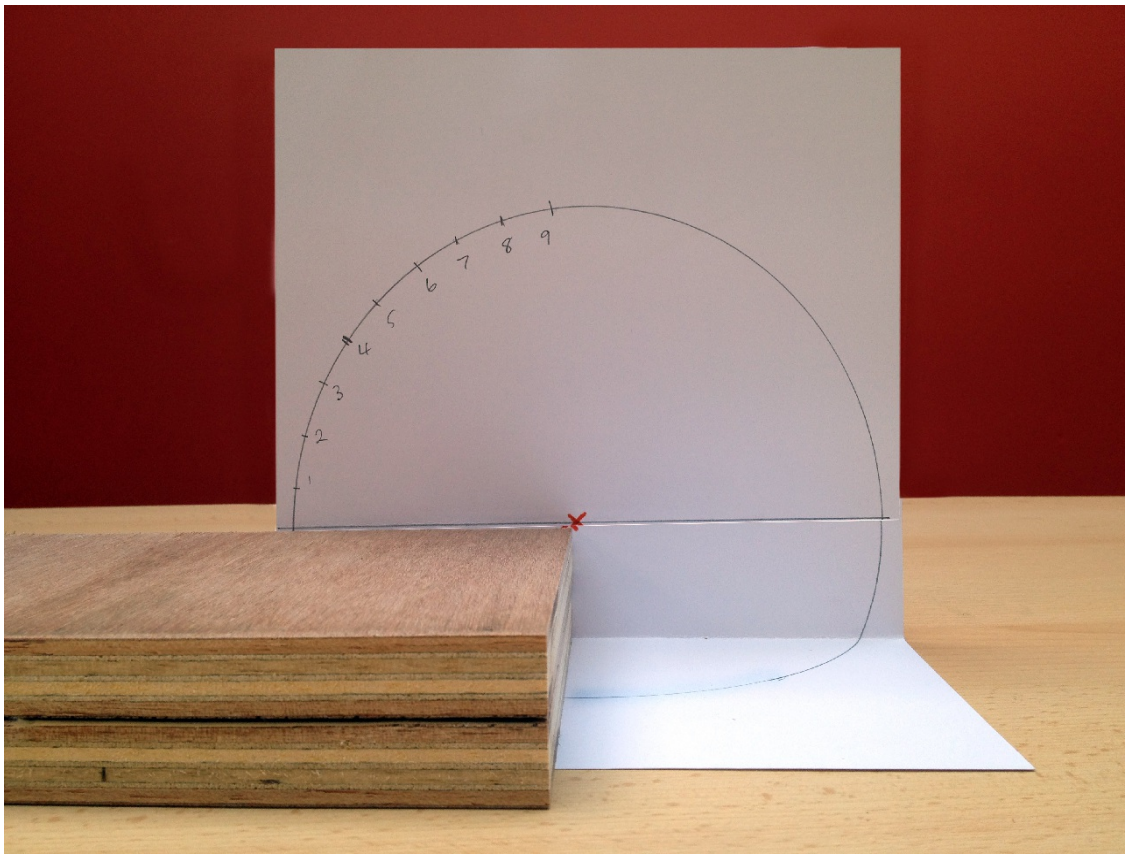


Fold the card under the wood and prop it up.



The line through the circle must line up with the top of the wood.

Make sure your apparatus looks like the picture.

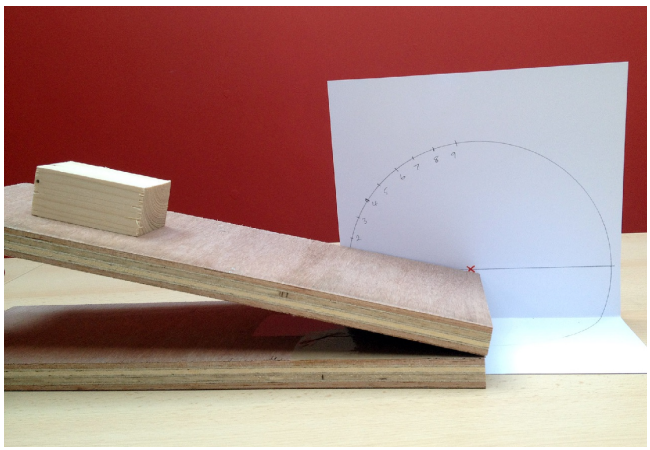


The experiment

Put an object on top of the wood.

Slowly Lift the top piece of wood to make a slope.

You must lift the wood very slowly.



When the object starts to slide,

look at the steepness scale + remember the number.

Try each experiment 3x three times.

Decide the best number + fill in the data sheet.

The experiment

Try different objects and fill in the data sheet:

Try the paperback book.

Try the plastic cup.

Try the scouring sponge on the rough side

Try the scouring sponge on the smooth side.

Try the block of wood on the thick edge.

Try the block of wood on the thin edge.

Questions

What is interesting about the two block of wood experiments?

Which objects slide easily.

Which objects do not slide easily

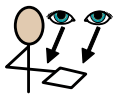
when would slipping on a slope be useful

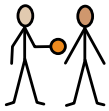
When would slipping on a slope be dangerous?

Think about activities in mountains.

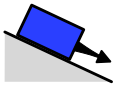
Where else would slipping on a slope be a problem?

Results poster

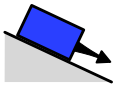




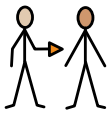
Make a poster showing your results.



Write about places where slipping on a slope is useful.



Write about places where slipping on a slope is dangerous.



Make you poster colourful.
